## PROFILE

Second-year Computer Science student and CTO of a pre-seed AI startup, where I own architecture, backend infrastructure, and engineering team direction. I work across the full stack but my main interest is backend systems, data pipelines, and developer tooling. Comfortable building real-world AI-integrated products and working at the intersection of engineering and product thinking. Seeking 2026 internships in backend, infrastructure, or systems engineering.

## EDUCATION

### University of Essex

Colchester, United Kingdom

BSc Computer Science, First-Class Honours (Expected 2027)

Feb 2024 – Present

- Highest Grade Award for top academic performance in cohort.
- Relevant modules: Algorithms & Data Structures, Systems Programming, Software Engineering, Machine Learning.
- Completed Boot.dev Back-End Development Path covering Python, Go, Linux, and core computer science fundamentals.

## EXPERIENCE

### Chief Technology Officer (CTO)

Nov 2025 – Present

Price Lantern — AI-Powered Quote Analysis Platform · Pre-seed Startup

Remote

- Founding engineer turned CTO at a pre-seed B2B AI platform for the construction and trade industry. Own full technical direction, infrastructure, and a small engineering team.
- Hired and manage one direct report through task delegation, PR reviews, and technical mentorship.
- Leading a full **v2 rewrite** in **FastAPI, Supabase, and React**, replacing the legacy **Django/Firebase** stack after identifying scalability bottlenecks in the original architecture.
- Designed a cache-first retail enrichment pipeline with parallel scraping across UK retailers (Screwfix, Toolstation, Wickes), Firebase TTL caching, and batched persistence — cold lookups run **~2x faster** than the old sequential approach, cached repeat queries **80–95% faster**.
- Built async document processing with background job execution and status tracking, giving users an instant response instead of blocking on the full analysis pipeline.
- Hardened the AI integration with retry logic, timeouts, and model upgrades for invoice and quote extraction from PDF documents. Running scraper and AI search in parallel cuts that phase by **~40–50%**.
- Architected product matching with **16-category classification**, multi-algorithm fuzzy matching (rapidfuzz), and unit normalisation across suppliers to make cross-supplier price comparisons actually reliable.
- Processed **2,000+ real-world invoices and quotes**, improving extraction consistency across messy real-world document formats.
- Built the test suite (**957+ lines**) covering normalisation, matching, and edge cases, plus **724 lines** of architecture docs and onboarding guides so future engineers aren't completely lost.

## SELECTED PROJECTS

### Pulse — Privacy-First Chat Analytics Engine | GitHub

2026

- Built a privacy-first analytics web app that processes large WhatsApp exports entirely in-browser using **React, TypeScript, and Web Workers** — no backend, no data ever leaves the device.
- Engineered a parsing and analytics pipeline that handles **800k+ lines / 1.3M+ messages** without blocking the UI.
- Modular analysis features: response times, activity heatmaps, behavioural trends, emoji usage, milestones, and conversation insights.
- Client-side export to **PNG, PDF, and standalone HTML** reports; ingests both **.txt** and **.zip** chat exports.

### Moji — Workspace-Centric Productivity App | usemoji.app

2025

- Full-stack productivity platform built with **FastAPI, Next.js, and Supabase (PostgreSQL)** — workspaces, tasks, notes, and rich-text pages.
- Secure auth with **JWT** and row-level security; modular REST API with typed schemas and a responsive TypeScript frontend with real-time updates.

### NAURI — Team Diet Tracking Application

2025

- Led an **8-person team** to build a full-stack diet tracking app; project achieved the **highest mark in the cohort**.
- Handled API design, integration, deployment, and cross-team coordination while also leading frontend development and UX/UI design.

### Vello — B2B Email Outreach Automation

2025

- Python backend for scalable cold email workflows with modular services for reply classification, inbox rotation, and send pacing.

TECHNICAL SKILLS

---

**Languages:** Python, Go, TypeScript/JavaScript, Java, C, SQL  
**Frameworks & Libraries:** FastAPI, Django, React, Next.js, Supabase, PostgreSQL, Firebase, rapidfuzz  
**AI & Tooling:** LLM integration, prompt engineering, document parsing pipelines, Claude Code, Cursor, Codex  
**Focus Areas:** Backend Systems, Infrastructure, Performance Optimisation, Developer Tooling  
**Languages (Spoken):** English (C1), Turkish (Native), German (A2)

Eligible to work in the UK
